Section 1 : Coding

1. Problem Statement

Kishore is studying data structures, and he is currently working on implementing a binary search tree (BST) and exploring its basic operations. He wants to practice creating a BST, inserting elements into it, and performing a specific operation, which is deleting the minimum element from the tree.

Write a program to help him perform the delete operation.

Input Format

The first line of input consists of an integer N, representing the number of elements Kishore wants to insert into the BST.

The second line consists of N space-separated integers, where each integer represents an element to be inserted into the BST.

Output Format

The output prints the remaining elements of the BST in ascending order (in-order traversal) after deleting the minimum element.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 6
5 3 8 2 4 6
Output: 3 4 5 6 8

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct TreeNode {
    int data;
    struct TreeNode* left;
    struct TreeNode* right;
};

struct TreeNode* createNode(int key) {
    struct TreeNode* newNode = (struct TreeNode*)malloc(sizeof(struct
TreeNode));
    newNode->data = key;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct TreeNode* insert(struct TreeNode* root, int key) {
    if (root == NULL) return createNode(key);
    if (key < root->data) root->left = insert(root->left, key);
    else if (key > root->data) root->right = insert(root->right, key);
    return root;
}
```

```
struct TreeNode* findMin(struct TreeNode* root) {
    while (root->left != NULL) root = root->left;
    return root;
}

struct TreeNode* deleteMin(struct TreeNode* root) {
    if (root == NULL) return NULL;
    if (root->left == NULL) {
        struct TreeNode* rightSubtree = root->right;
        free(root);
        return rightSubtree;
    }
    root->left = deleteMin(root->left);
    return root;
}

void inorderTraversal(struct TreeNode* root) {
    if (root != NULL) {
        inorderTraversal(root->left);
        printf("%d ", root->data);
        inorderTraversal(root->right);
    }
}

int main() {
    int N;
    scanf("%d", &N);

    struct TreeNode* root = NULL;
    for (int i = 0; i < N; i++) {
        int key;
        scanf("%d", &key);
        root = insert(root, key);
    }

    root = deleteMin(root);

    inorderTraversal(root);
    return 0;
}
```

Status : Correct *Marks : 10/10*

2. Problem Statement

John is building a system to store and manage integers using a binary search tree (BST). He needs to add a feature that allows users to search for a specific integer key in the BST using recursion.

Implement functions to create the BST and perform a recursive search for an integer.

Input Format

The first line of input consists of an integer representing, the number of nodes.

The second line consists of integers representing, the values of nodes, separated by space.

The third line consists of an integer representing, the key to be searched.

Output Format

The output prints whether the given key is present in the binary search tree or not.

Refer to the sample output for the exact format.

Sample Test Case

Input: 7
10 5 15 3 7 12 20
12
Output: The key 12 is found in the binary search tree

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>
```

```
struct TreeNode {
    int data;
    struct TreeNode* left;
    struct TreeNode* right;
};

struct TreeNode* createNode(int key) {
    struct TreeNode* newNode = (struct TreeNode*)malloc(sizeof(struct
TreeNode));
    newNode->data = key;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct TreeNode* insert(struct TreeNode* root, int key) {
    if (root == NULL) return createNode(key);
    if (key < root->data) root->left = insert(root->left, key);
    else if (key > root->data) root->right = insert(root->right, key);
    return root;
}

int search(struct TreeNode* root, int key) {
    if (root == NULL) return 0;
    if (root->data == key) return 1;
    if (key < root->data) return search(root->left, key);
    return search(root->right, key);
}

int main() {
    int N, key;
    scanf("%d", &N);

    struct TreeNode* root = NULL;
    for (int i = 0; i < N; i++) {
        int value;
        scanf("%d", &value);
        root = insert(root, value);
    }

    scanf("%d", &key);

    if (search(root, key))
```

```
        printf("The key %d is found in the binary search tree\n", key);
    else
        printf("The key %d is not found in the binary search tree\n", key);

    return 0;
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

You are given a series of magic levels (integers) and need to construct a Binary Search Tree (BST) from them. After constructing the BST, your task is to perform a range search, which involves finding and printing all the magic levels within a specified range [L, R].

Input Format

The first line of input consists of an integer N, the number of magic levels to insert into the BST.

The second line consists of N space-separated integers, representing the magic levels to insert.

The third line consists of two integers, L and R, which define the range for the search.

Output Format

The output prints all the magic levels within the range [L, R] in ascending order, separated by spaces.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 3 7
2 20
Output: 3 5 7 10 15

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct TreeNode {
    int data;
    struct TreeNode* left;
    struct TreeNode* right;
};

struct TreeNode* createNode(int key) {
    struct TreeNode* newNode = (struct TreeNode*)malloc(sizeof(struct
TreeNode));
    newNode->data = key;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct TreeNode* insert(struct TreeNode* root, int key) {
    if (root == NULL) return createNode(key);
    if (key < root->data) root->left = insert(root->left, key);
    else if (key > root->data) root->right = insert(root->right, key);
    return root;
}

void rangeSearch(struct TreeNode* root, int L, int R) {
    if (root != NULL) {
        if (root->data > L) rangeSearch(root->left, L, R);
        if (root->data >= L && root->data <= R) printf("%d ", root->data);
        if (root->data < R) rangeSearch(root->right, L, R);
    }
}

int main() {
    int N, L, R;
    scanf("%d", &N);

    struct TreeNode* root = NULL;
    for (int i = 0; i < N; i++) {
        int key;
        scanf("%d", &key);
```

```
        root = insert(root, key);
    }

    scanf("%d %d", &L, &R);

    rangeSearch(root, L, R);

    return 0;
}
```

Section 1 : Coding

1. Problem Statement

Arun is exploring operations on binary search trees (BST). He wants to write a program with an unsorted distinct integer array that represents the BST keys and construct a height-balanced BST from it.

After constructing, he wants to perform the following operations that can alter the structure of the tree and traverse them using a level-order traversal:

InsertionDeletion

Your task is to assist Arun in completing the program without any errors.

Input Format

The first line of input consists of an integer N, representing the number of initial

keys in the BST.

The second line consists of N space-separated integers, representing the initial keys.

The third line consists of an integer X, representing the new key to be inserted into the BST.

The fourth line consists of an integer Y, representing the key to be deleted from the BST.

Output Format

The first line of output prints "Initial BST: " followed by a space-separated list of keys in the initial BST after constructing it in level order traversal.

The second line prints "BST after inserting a new node X: " followed by a space-separated list of keys in the BST after inserting X n level order traversal.

The third line prints "BST after deleting node Y: " followed by a space-separated list of keys in the BST after deleting Y n level order traversal.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
25 14 56 28 12
34
12
Output: Initial BST: 25 14 56 12 28
BST after inserting a new node 34: 25 14 56 12 28 34
BST after deleting node 12: 25 14 56 28 34

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
```

```
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = NULL;
    newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

struct Node* findMin(struct Node* root) {
    while (root->left) root = root->left;
    return root;
}

struct Node* deleteNode(struct Node* root, int data) {
    if (!root) return root;
    if (data < root->data) root->left = deleteNode(root->left, data);
    else if (data > root->data) root->right = deleteNode(root->right, data);
    else {
        if (!root->left) {
            struct Node* temp = root->right;
            free(root);
            return temp;
        } else if (!root->right) {
            struct Node* temp = root->left;
            free(root);
            return temp;
        }
        struct Node* temp = findMin(root->right);
        root->data = temp->data;
        root->right = deleteNode(root->right, temp->data);
    }
```

```
    return root;
}

void levelOrderTraversal(struct Node* root) {
    if (!root) return;
    struct Node* queue[100];
    int front = 0, rear = 0;
    queue[rear++] = root;
    while (front < rear) {
        struct Node* temp = queue[front++];
        printf("%d ", temp->data);
        if (temp->left) queue[rear++] = temp->left;
        if (temp->right) queue[rear++] = temp->right;
    }
    printf("\n");
}

int main() {
    int N, X, Y;
    scanf("%d", &N);
    int arr[N];
    for (int i = 0; i < N; i++) scanf("%d", &arr[i]);
    scanf("%d %d", &X, &Y);

    struct Node* root = NULL;
    for (int i = 0; i < N; i++) root = insert(root, arr[i]);

    printf("Initial BST: ");
    levelOrderTraversal(root);

    root = insert(root, X);
    printf("BST after inserting a new node %d: ", X);
    levelOrderTraversal(root);

    root = deleteNode(root, Y);
    printf("BST after deleting node %d: ", Y);
    levelOrderTraversal(root);

    return 0;
}
```

Status : Correct *Marks : 10/10*

2. Problem Statement

Joseph, a computer science student, is interested in understanding binary search trees (BST) and their node arrangements. He wants to create a program to explore BSTs by inserting elements into a tree and displaying the nodes using post-order traversal of the tree.

Write a program to help Joseph implement the program.

Input Format

The first line of input consists of an integer N, representing the number of elements to insert into the BST.

The second line consists of N space-separated integers data, which is the data to be inserted into the BST.

Output Format

The output prints N space-separated integer values after the post-order traversal.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 4
10 15 5 3
Output: 3 5 15 10

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};
```

```
struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = NULL;
    newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

void postOrderTraversal(struct Node* root) {
    if (!root) return;
    postOrderTraversal(root->left);
    postOrderTraversal(root->right);
    printf("%d ", root->data);
}

int main() {
    int N;
    scanf("%d", &N);
    int arr[N];

    for (int i = 0; i < N; i++) scanf("%d", &arr[i]);

    struct Node* root = NULL;
    for (int i = 0; i < N; i++) root = insert(root, arr[i]);

    postOrderTraversal(root);
    printf("\n");

    return 0;
}
```

Status : Correct **Marks : 10/10**

3. Problem Statement

Yogi is working on a program to manage a binary search tree (BST) containing integer values. He wants to implement a function that removes nodes from the tree that fall outside a specified range defined by a minimum and maximum value.

Help Yogi by writing a function that achieves this.

Input Format

The first line of input consists of an integer N, representing the number of elements to be inserted into the BST.

The second line consists of N space-separated integers, representing the elements to be inserted into the BST.

The third line consists of two space-separated integers min and max, representing the minimum value and the maximum value of the range.

Output Format

The output prints the remaining elements of the BST in an in-order traversal, after removing nodes that fall outside the specified range.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 20 12
5 15

Output: 5 10 12 15

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
```

```
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = NULL;
    newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}

struct Node* trimBST(struct Node* root, int min, int max) {
    if (!root) return NULL;

    root->left = trimBST(root->left, min, max);
    root->right = trimBST(root->right, min, max);

    if (root->data < min) {
        struct Node* temp = root->right;
        free(root);
        return temp;
    }
    if (root->data > max) {
        struct Node* temp = root->left;
        free(root);
        return temp;
    }
    return root;
}

void inOrderTraversal(struct Node* root) {
    if (!root) return;
    inOrderTraversal(root->left);
```

```
    printf("%d ", root->data);
    inOrderTraversal(root->right);
}

int main() {
    int N, min, max;
    scanf("%d", &N);
    int arr[N];
    for (int i = 0; i < N; i++) scanf("%d", &arr[i]);
    scanf("%d %d", &min, &max);

    struct Node* root = NULL;
    for (int i = 0; i < N; i++) root = insert(root, arr[i]);

    root = trimBST(root, min, max);

    inOrderTraversal(root);
    printf("\n");

    return 0;
}
```

Status : Correct **Marks : 10/10**

4. Problem Statement

Viha, a software developer, is working on a project to automate searching for a target value in a Binary Search Tree (BST). She needs to create a program that takes an integer target value as input and determines if that value is present in the BST or not.

Write a program to assist Viha.

Input Format

The first line of input consists of integers separated by spaces, which represent the elements to be inserted into the BST. The input is terminated by entering -1.

The second line consists of an integer target, which represents the target value to be searched in the BST.

Output Format

If the target value is found in the BST, print "[target] is found in the BST".

Else, print "[target] is not found in the BST"

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5 3 7 1 4 6 8 -1
4
Output: 4 is found in the BST

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = NULL;
    newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
}
```

```
int search(struct Node* root, int target) {
    if (!root) return 0;
    if (root->data == target) return 1;
    if (target < root->data) return search(root->left, target);
    return search(root->right, target);
}

int main() {
    struct Node* root = NULL;
    int num, target;

    while (1) {
        scanf("%d", &num);
        if (num == -1) break;
        root = insert(root, num);
    }

    scanf("%d", &target);

    if (search(root, target))
        printf("%d is found in the BST\n", target);
    else
        printf("%d is not found in the BST\n", target);

    return 0;
}
```

Status : Correct **Marks : 10/10**

5. Problem Statement

Aishu is participating in a coding challenge where she needs to reconstruct a Binary Search Tree (BST) from given preorder traversal data and then print the in-order traversal of the reconstructed BST.

Since Aishu is just learning about tree data structures, she needs your help to write a program that does this efficiently.

Input Format

The first line consists of an integer n, representing the number of nodes in the BST.

The second line of input contains n integers separated by spaces, which represent the preorder traversal of the BST.

Output Format

The output displays n space-separated integers, representing the in-order traversal of the reconstructed BST.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 6
10 5 1 7 40 50
Output: 1 5 7 10 40 50

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = NULL;
    newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int data) {
    if (!root) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else root->right = insert(root->right, data);
    return root;
```

```
}

void inOrderTraversal(struct Node* root) {
    if (!root) return;
    inOrderTraversal(root->left);
    printf("%d ", root->data);
    inOrderTraversal(root->right);
}

int main() {
    int N;
    scanf("%d", &N);
    int arr[N];

    for (int i = 0; i < N; i++)
    scanf("%d", &arr[i]);

    struct Node* root = NULL;
    for (int i = 0; i < N; i++) root = insert(root, arr[i]);

    inOrderTraversal(root);
    printf("\n");

    return 0;
}
```

Section 1 : Coding

1. Problem Statement

John, a computer science student, is learning about binary search trees (BST) and their properties. He decides to write a program to create a BST, display it in post-order traversal, and find the minimum value present in the tree.

Help him by implementing the program.

Input Format

The first line of input consists of an integer N, representing the number of elements to insert into the BST.

The second line consists of N space-separated integers data, which is the data to be inserted into the BST.

Output Format

The first line of output prints the space-separated elements of the BST in post-order traversal.

The second line prints the minimum value found in the BST.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 3
5 10 15
Output: 15 10 5
The minimum value in the BST is: 5

Answer

```
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int data) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = data;
    newNode->left = newNode->right = NULL;
    return newNode;
}

// You are using GCC
struct Node* insert(struct Node* root, int data) {
    if (root == NULL) return createNode(data);
    if (data < root->data) root->left = insert(root->left, data);
    else if (data > root->data) root->right = insert(root->right, data);
    return root;
}
```

```
void displayTreePostOrder(struct Node* root) {
    if (root != NULL) {
        displayTreePostOrder(root->left);
        displayTreePostOrder(root->right);
        printf("%d ", root->data);
    }
}

int findMinValue(struct Node* root) {
    while (root->left != NULL) root = root->left;
    return root->data;
}

int main() {
    struct Node* root = NULL;
    int n, data;
    scanf("%d", &n);

    for (int i = 0; i < n; i++) {
        scanf("%d", &data);
        root = insert(root, data);
    }

    displayTreePostOrder(root);
    printf("\n");

    int minValue = findMinValue(root);
    printf("The minimum value in the BST is: %d", minValue);

    return 0;
}
```

Section 1 : Coding

1. Problem Statement

You are required to implement basic operations on a Binary Search Tree (BST), like insertion and searching.

Insertion: Given a list of integers, construct a Binary Search Tree by repeatedly inserting each integer into the tree according to the rules of a BST.

Searching: Given an integer, search for its presence in the constructed Binary Search Tree. Print whether the integer is found or not.

Write a program to calculate this efficiently.

Input Format

The first line of input consists of an integer n, representing the number of nodes

in the binary search tree.

The second line consists of the values of the nodes, separated by space as integers.

The third line consists of an integer representing, the value that is to be searched.

Output Format

The output prints, "Value <value> is found in the tree." if the given value is present, otherwise it prints: "Value <value> is not found in the tree."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 7
8 3 10 1 6 14 23
6
Output: Value 6 is found in the tree.

Answer

```
// You are using GCC
#include <stdio.h>
#include <stdlib.h>

struct Node {
    int data;
    struct Node* left;
    struct Node* right;
};

struct Node* createNode(int value) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->data = value;
    newNode->left = newNode->right = NULL;
    return newNode;
}

struct Node* insert(struct Node* root, int value) {
    if (root == NULL) return createNode(value);
```

```
    if (value < root->data) root->left = insert(root->left, value);
    else if (value > root->data) root->right = insert(root->right, value);
    return root;
}

int search(struct Node* root, int key) {
    if (root == NULL) return 0;
    if (root->data == key) return 1;
    if (key < root->data) return search(root->left, key);
    return search(root->right, key);
}

int main() {
    int n, key;
    scanf("%d", &n);

    struct Node* root = NULL;
    for (int i = 0; i < n; i++) {
        int value;
        scanf("%d", &value);
        root = insert(root, value);
    }

    scanf("%d", &key);

    if (search(root, key)) printf("Value %d is found in the tree.\n", key);
    else printf("Value %d is not found in the tree.\n", key);

    return 0;
}
```

Section 1 : Coding

1. Problem Statement

John is learning about Binary Search Trees (BST) in his computer science class. He wants to create a program that allows users to delete a node with a given value from a BST and print the remaining nodes using an in-order traversal.

Implement a function to help him delete a node with a given value from a BST.

Input Format

The first line of input consists of an integer N, representing the number of nodes in the BST.

The second line consists of N space-separated integers, representing the values of the BST nodes.

The third line consists of an integer V, which is the value to delete from the BST.

Output Format

The output prints the space-separated values in the BST in an in-order traversal, after the deletion of the specified value.

If the specified value is not available in the tree, print the given input values in-order traversal.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 5
10 5 15 2 7
15

Output: 2 5 7 10

Answer

```
#include <stdio.h>
#include <stdlib.h>

struct TreeNode {
    int data;
    struct TreeNode* left;
    struct TreeNode* right;
};

struct TreeNode* createNode(int key) {
    struct TreeNode* newNode = (struct TreeNode*)malloc(sizeof(struct
TreeNode));
    newNode->data = key;
    newNode->left = newNode->right = NULL;
    return newNode;
}

// You are using GCC

struct TreeNode* insert(struct TreeNode* root, int key) {
```

```
    if (root == NULL) return createNode(key);
    if (key < root->data) root->left = insert(root->left, key);
    else if (key > root->data) root->right = insert(root->right, key);
    return root;
}

struct TreeNode* findMin(struct TreeNode* root) {
    while (root->left != NULL) root = root->left;
    return root;
}

struct TreeNode* deleteNode(struct TreeNode* root, int key) {
    if (root == NULL) return root;
    if (key < root->data) root->left = deleteNode(root->left, key);
    else if (key > root->data) root->right = deleteNode(root->right, key);
    else {
        if (root->left == NULL) {
            struct TreeNode* temp = root->right;
            free(root);
            return temp;
        } else if (root->right == NULL) {
            struct TreeNode* temp = root->left;
            free(root);
            return temp;
        }
        struct TreeNode* temp = findMin(root->right);
        root->data = temp->data;
        root->right = deleteNode(root->right, temp->data);
    }
    return root;
}

void inorderTraversal(struct TreeNode* root) {
    if (root != NULL) {
        inorderTraversal(root->left);
        printf("%d ", root->data);
        inorderTraversal(root->right);
    }
}

int main()
{
    int N, rootValue, V;
```

```
    scanf("%d", &N);
    struct TreeNode* root = NULL;
    for (int i = 0; i < N; i++) {
        int key;
        scanf("%d", &key);
        if (i == 0) rootValue = key;
        root = insert(root, key);
    }
    scanf("%d", &V);
    root = deleteNode(root, V);
    inorderTraversal(root);
    return 0;
}
```

1. While inserting the elements 5, 4, 2, 8, 7, 10, 12 in a binary search tree, the element at the lowest level is _____.

Answer

12

Status : Correct ***Marks : 1/1***

2. Which of the following is the correct post-order traversal of a binary search tree with nodes: 50, 30, 20, 55, 32, 52, 57?

Answer

20, 32, 30, 52, 57, 55, 50

Status : Correct ***Marks : 1/1***

3. Which of the following is a valid preorder traversal of the binary search tree with nodes: 18, 28, 12, 11, 16, 14, 17?

Answer

18, 12, 11, 16, 14, 17, 28

Status : Correct ***Marks : 1/1***

4. Find the preorder traversal of the given binary search tree.

Answer

9, 2, 1, 6, 4, 7, 10, 14

Status : Correct ***Marks : 1/1***

5. Find the pre-order traversal of the given binary search tree.

Answer

13, 2, 1, 4, 14, 18

Status : Correct ***Marks : 1/1***

6. Which of the following operations can be used to traverse a Binary Search Tree (BST) in ascending order?

Answer

Inorder traversal

Status : Correct ***Marks : 1/1***

7. Find the in-order traversal of the given binary search tree.

Answer

1, 2, 4, 13, 14, 18

Status : Correct ***Marks : 1/1***

8. While inserting the elements 71, 65, 84, 69, 67, 83 in an empty binary search tree (BST) in the sequence shown, the element in the lowest level is _____.

Answer

83

Status : Wrong ***Marks : 0/1***

9. Which of the following is the correct pre-order traversal of a binary search tree with nodes: 50, 30, 20, 55, 32, 52, 57?
